### 7KT PAC1200 multichannel current measuring system

The 7KT PAC1200 multichannel current measuring system monitors and displays the energy consumption of up to 96 outgoing feeders. The Data Manager can supply up to eight sensor bars. The full configuration would thus be 8 sensor bars with 12 sensors each.

The system makes energy consumption and the resulting costs transparent for a given installation.

The system can be adapted to individual needs and application scenarios. In addition, single sensors can be named individually and compared with each other.

The system can also be configured flexibly as the number of sensor bars can be varied.

Up to eight different, selectable consumption sources can be compared with each other.

The measured values can be displayed via a Web browser. Both current values and statistical values can be displayed here. Display is possible in an application for mobile terminal devices, as a desktop application, or in powermanager.

Statistical values can be collected over different time periods and exported via a CSV file.

3KC9000-8EL62	1.8m Connecting cable

Note: The 3KC9000-8EL62 connecting cable is required with the 3KC9000-8EL10

## SENTRON ATC6300

The SENTRON ATC6300 is ideally suited for low voltage power supplies thanks to its wide voltage range covering 100 to 480V. SENTRON ATC6300 allows the implementation of an automatic transfer control unit in conjunction with compact molded case circuit breakers MCCB, air circuit breakers ACB, switch disconnectors LBS, or contactors.

The 3KC ATC6300 can be integrated into a communication environment using expansion modules. For communication, the 3KC ATC6300 supports Modbus RTU, Modbus TCP as well as Modbus ASCII protocols via the optional RS 485 and Ethernet interfaces.

The 3KC ATC6300 offers the following metering functions:

- | Phase sequence
- | Phase failure
- | Minimum / maximum voltage
- | Minimum / maximum frequency
- | Voltage unbalance

For use with Siemens 3KC3 and 3KC4 Remote Transfer Switches, 3WL/3WA/3WT ACB's and 3VA MCCB's

### Note

The auxiliary switches indicate the switch position of the respective switch disconnecter (I or II) to which they or the auxiliary switch module are connected.

Two auxiliary switches in total are required for each item of transfer switching equipment in order to be able to distinguish between all switching positions (I, O, II). In the case of transfer switching equipment sizes 1 and 2, two auxiliary switch modules must be mounted on the transfer switching equipment, one on the left and one on the right.

At least one auxiliary switch must be installed for each auxiliary switch module.

In the case of transfer switching equipment sizes 3 to 5, the two auxiliary switches only need to be mounted in different rows on the underside of the transfer switching equipment, one auxiliary switch at switch disconnecter I and one at switch disconnecter II.

# REMOTE (RTSE) AND AUTOMATIC (ATSE) TRANSFER SWITCHING EQUIPMENT

The 3KC transfer switching equipment offers reliable switchover between two current sources.

## Remote transfer switching equipment (RTSE) 3KC3 3KC4

Remote transfer switching equipment is used wherever automatic remote switching is required, but there is already a separate controller (e.g. ATC6300 controller) in the plant. Remote transfer switching equipment consists of two switch disconnectors fused into one, forming an intrinsic electrical interlock.

## Automatic transfer switching equipment (ATSE) 3KC6 3KC8

Automatic transfer switching equipment with motorized operating mechanisms and internal controllers are used as complete devices wherever automatic remote switching is required and a separate controller is not available. 3KC automatic transfer switching equipment is approved in compliance with IEC 60947-6-1.

# MOTOR STARTER INFEED SYSTEM - 3RV29

The 3RV29 infeed system is a convenient means of energy supply and distribution for a group of several motor starter protectors or complete load feeders with a screw or spring-type connection up to 18.5kW (40A) in size S00 and S0 circuit breakers and contactors.

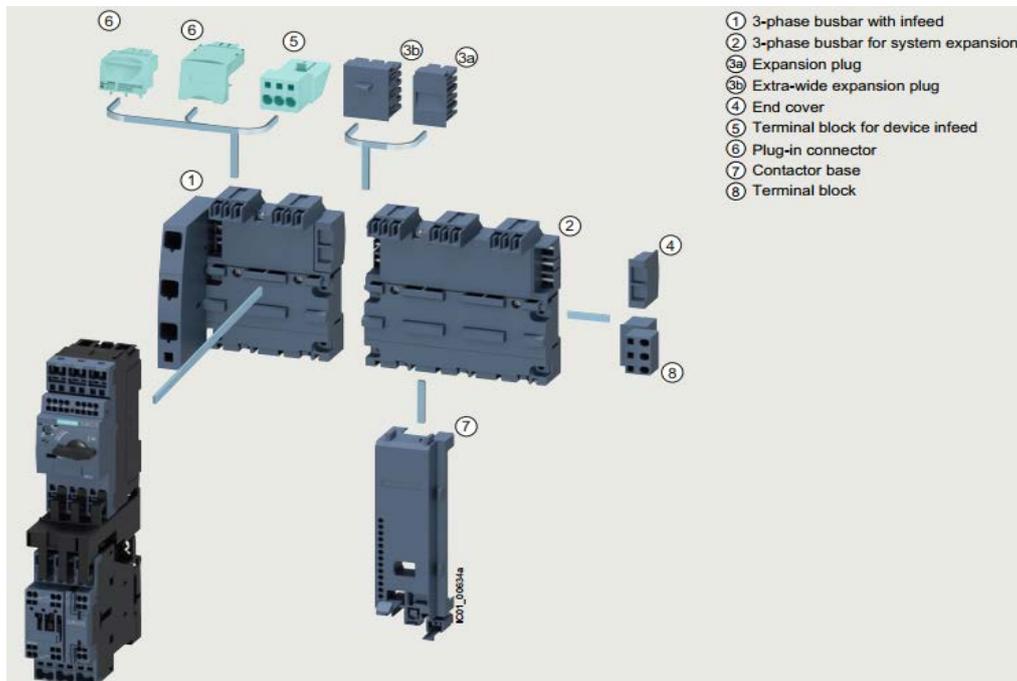

The modular combination of basic module and expansion module by means of expansion plug enables requirement-oriented expansion of the infeed system. The system is set up extremely easily and quickly thanks to simple plug-in mounting, and it enables fast and uncomplicated installation and replacement of load feeders.

## Benefits at a glance

- | Time savings during installation thanks to simple plug-in technology
- | Flexibility in mountin and expansion
- | More free space in the control cabinet – thanks to compact design
- | Maximum current-carrying capacity of 63 A
- | Infeed optionally on the right or the left with up to 25 mm<sup>2</sup> conductor cross-section
- | High vibration-resistance, especially for switching devices with spring-loaded terminals
- | Reversing DOL starters can be accomodated.

# SIMOCODE - INTELLIGENT MOTOR MANAGEMENT RELAY

SIMOCODE pro offers multifunctional, solid-state full motor protection. The motor management system monitors, protects and controls constant-speed motors and enables the implementation of predictive maintenance. It does not wait for a problem to occur before shutting down the motor, but establishes a level of transparency in advance. This avoids plant standstills and improves economic efficiency. SIMOCODE pro delivers detailed operating, service and diagnostic data from across the entire process. The engineering is simple and likewise the integration into process control systems. SIMOCODE pro communicates via PROFIBUS and PROFINET, Modbus, EtherNet / IP and OPC UA. It implements simple and economical motor management.

Simocode is a modular system. Choose 1 item from each selection group below. Selections 1...3 are always required for a typical system. Selections 4...7 are optional.

The background of the entire page is a photograph of Rittal outdoor enclosures. On the left, a large, closed cabinet with two doors and a perforated panel is visible. To its right, another enclosure is shown with its doors open, revealing a multi-tiered interior structure with various components and wiring. The scene is set against a dark, reflective surface, creating a subtle reflection of the units below.

# DC UPS

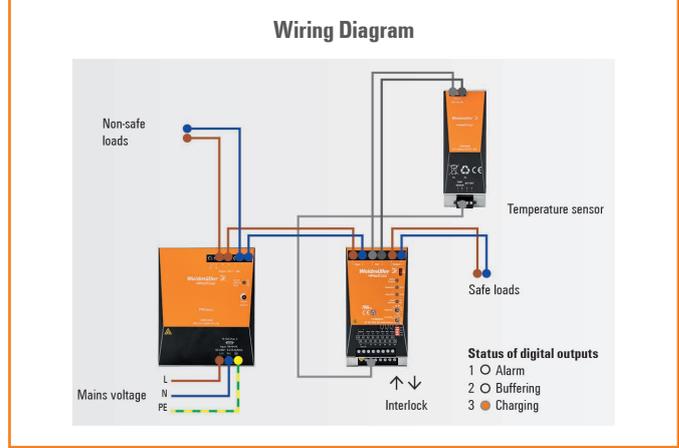

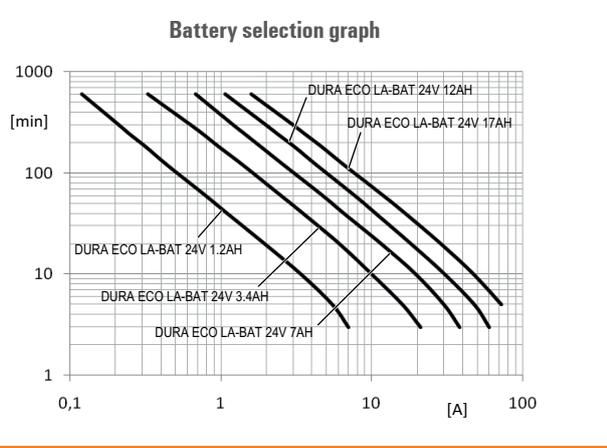

**Avoid costly machine downtimes machine downtimes.** Weidmüller's uninterruptible power supplies reliably protect 24 V DC consumers from power failures and voltage drops, which can affect system availability. Together with the associated battery module and the power supply unit, the UPS control unit forms a complete DC UPS system with backup times in the range of minutes to hours.

## DC Buffering

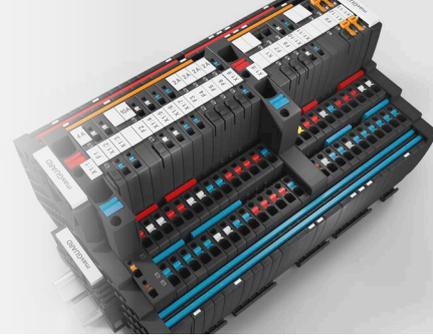

1. If your duration is short (<5s), consider using a buffer module, otherwise consider a DC UPS.
2. Determine your maximum load current and maximum buffering time.
3. Refer to the battery selection table to choose the most suitable battery to go with your DC UPS.

## maxGUARD modular Electronic Fuse

- Select feed in module depending if you need remote reset or not.
- Select your required electronic fuse cards depending on your loads. Keep in mind not to exceed 40A max.
- Select your cross connects for the positive, negative and communication channels. If the total current is >20A, you will need to use 2 cross connects each for the positive and negative channels.

### Notes:

- Maximum limit of 25 fuse modules on a single AMG FIM-C or AMG CM module.
- EX, conformal coated fuses and additional accessories are available from the full catalogue.

# INSTRUMENTATION

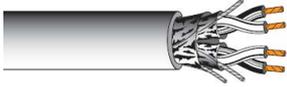

## OVERALL SCREENED INSTRUMENTATION CABLES

Instrumentation and control cables are used to connect sensors and equipment to monitors and control panels. Overall screening provides moderate protection from induced noise and interference. Where extra physical protection is required, Steel Wire Armoured (SWA) versions are available. Blue jackets for intrinsically safe applications available upon request.

# ACCESS CONTROL CABLES

Belden patented Banana Peel construction affixes the individual cables to a center spline, eliminating the need for an overall jacket. The individual cable components are color coded by application and have the application printed on jackets, all jackets have a rip cords for easy removal. Access control cables are used to monitor, open and close gates, doors and booms. Composite access control cables allow for a single run from the controller to the door thereby saving installation costs and simplifying cable routing.

### About EMC types in different Katko enclosures

- | **KEM** Polycarbonate EMC enclosed switches include a copper spray coating inside the enclosure, and 2 x Nickel-plated Brass, EMC cable glands with a lock nut.
- | **KEA** Aluminium EMC enclosed switches are intrinsically EMC resistant. They are supplied with 2 x Nickel-plated Brass, EMC cable glands as standard. EMC glands are also available individually for spares or replacements.
- | **KER** Stainless Steel EMC enclosed switches are intrinsically EMC resistant. They are supplied with 2 x Nickel-plated Brass, EMC cable glands with lock nuts as standard. EMC glands are also available individually for spares or replacements.
- | **KET** Sheet Steel EMC enclosed switches are intrinsically EMC resistant. They are supplied with 2 x Nickel-plated Brass, EMC cable glands with lock nuts as standard. EMC glands are also available individually for spares or replacements.

### Questions and answers about EMC enclosed switches

*What the difference is between standard brass and EMC brass or stainless steel EMC glands?*

- | Standard cable glands are not suitable for EMC use.
- | EMC glands have contact springs that make contact with the shielding of the cable for correct earthing.
- | Katko EMC cable glands are Nickel plated brass. However, brass or stainless steel types are common.
- | EMC paint piercing locking nuts should be used with painted enclosures (KET types).

*Are Katko KER Stainless Steel IP69K enclosed switches suitable for EMC applications?*

- | Yes, if they are supplied with the appropriate EMC cable glands, the glands themselves will have the same IP69K rating.

*Are Katko EMC cable glands available for separate order for use with various metal enclosures?*

- | Yes - refer following pages.

# KATKO ISOLATORS & AUXILIARIES TO SUIT FROM 2024 AND BEFORE

## How to use the table below

- Part numbers in BOLD above are types that take the new auxiliaries 1NO40KU and 1NC40KU from 2024 onwards.
- Until the end of 2023, enclosed switches rated 16A – 40A used KU1V or KU2V auxiliaries.
- When ordering auxiliaries for enclosed switches, consider that only 1NO contact may be needed. There is usually no need for separate 1 x N/O and
- 1 x N/C contacts, which not only takes up more room in the enclosure, but costs more. 1 x NC should be ordered only if needed.
- 3 and 4 pole types fit the same auxiliaries.
- EMC types fit the same auxiliaries as standard 3 or 4 pole types.
- All larger enclosed and open switches 100A to 800A not shown below, use 1V160KU or 2V160KU auxiliaries.

All LoadSafe switches from 200 to 800 amps & 160 amp (P) are available with direct handle or external handle. Both handles are easily installed and padlockable. Standard external handle for 315-800 amps is LKX 150 (left). For 200-250 amps and 160 amp (P) LKX 100 (middle) is the standard option. Both versions are also available in yellow/red colours when needed.

Easy to install auxiliary contacts are side mounting and available in 1NO/NC C/O and 2NO/NC C/O versions. It is possible to install two auxiliary units on either side making. The same auxiliary contact unit is compatible with KU switches ranging 100 to 800 amps.  
1 x NO/NC CO, fit max: 2 each side  
2 x NO/NC CO, fit max: 2 each side

## LOAD BREAK SWITCHES

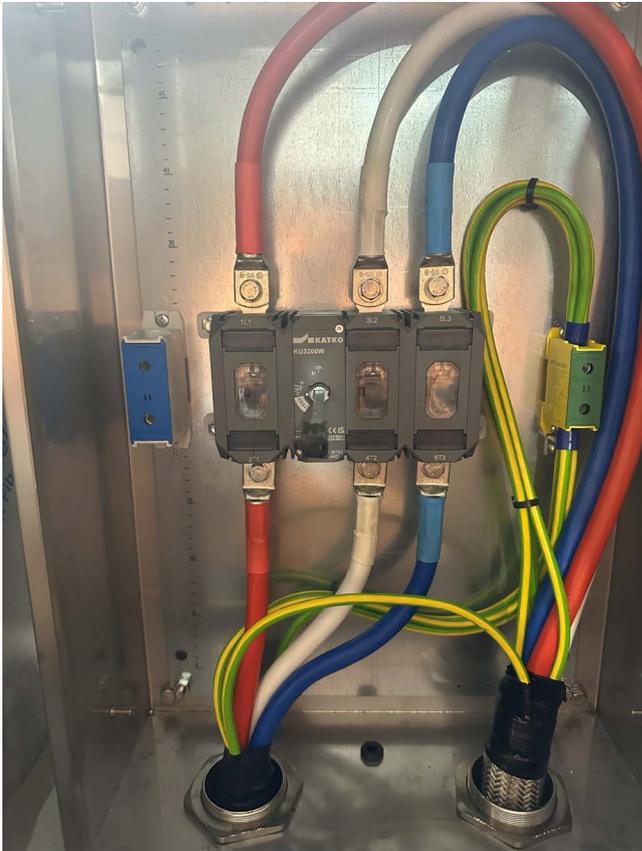

### KU SERIES, 200 – 800 A, PANEL MOUNT

Terminal covers are available in two versions – flush (left) and high (middle). The high terminal cover type is specifically made to be used with KATKO's vertical cable connectors.

Phase barriers (right) are flexible rubber and can be fitted in with many types and sizes of connectors.

Visual contacts provide increased safety and reassurance to the user. Locking the switch to OFF-position and visually inspecting the contacts ensures safe operation of Katko LoadSafe switches.

# CHANGEOVER LOAD BREAK SWITCHES

## KU SERIES, 100A, 125A, 160 A, PANEL MOUNT ROTARY OPERATION

- | Consists of two 3 or 4-pole switches and a change-over kit.
- | KU 100 - 160 A, 3 pole changeover switches are user assembled using two 3 pole switches and a changeover kit.
- | KU 100 - 160 A, 4 pole changeover switches are APS factory assembled using two 4-pole switches and a changeover kit.
- | Switch technology by means of silver contacts ensures safe and durable operation.
- | All versions are operable with direct handle or external handle and shaft.
- | For KU\_100 to KU\_160, a shaft and external handle can be ordered separately when needed.
- | KU\_100 to KU\_160 use a side-mountable auxiliary contact, available in 1NO + 1NC or 2NO + 2NC.
- | It is possible to mount two auxiliary contacts on each switch, making up a maximum number of contacts of 4NO + 4NC on each switch.

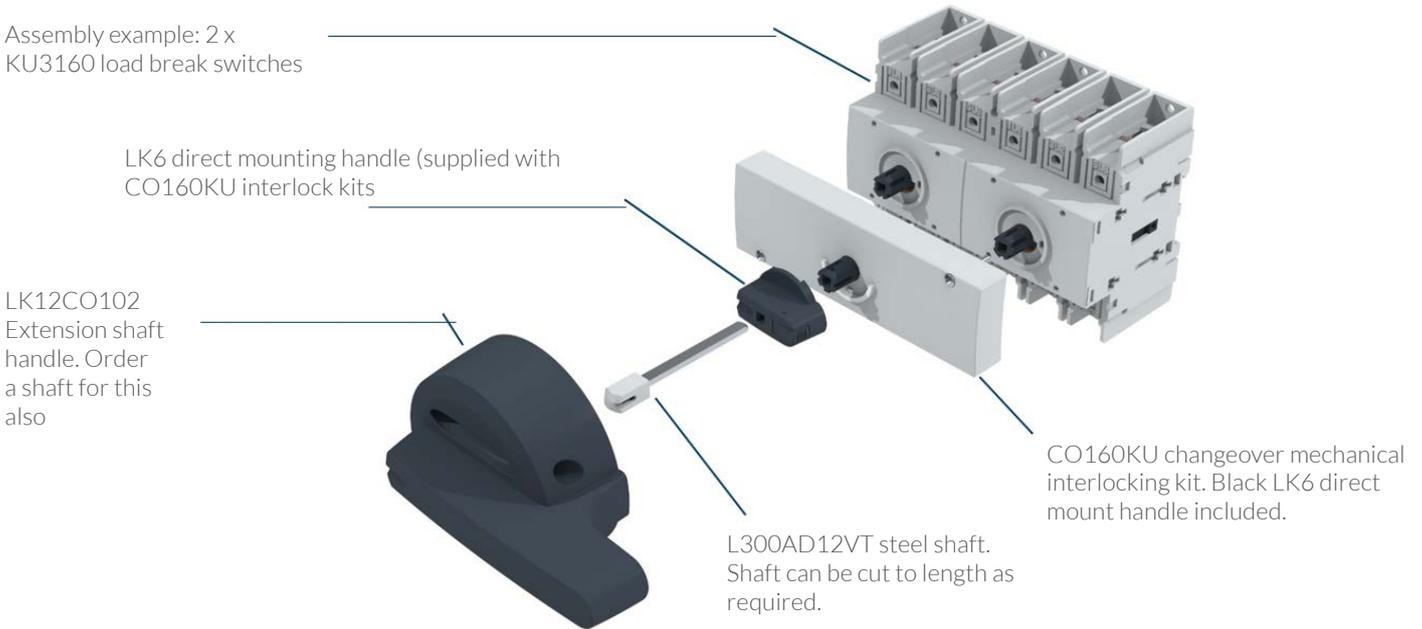

### Assembly and ordering:

Example of a **KU3160CO**, 3 pole, 100 A, changover switch with direct mount or extension handle. A **KU3160CO** consists of 2 x KU3160, 3 pole load break switches, and 1 x CO160KU top mount, clip-on changeover kit.

### Assembly and options:

Different switch configurations using the CO160KU changeover interlock using standard 3P or specially assembled 4 pole switches.

Assembly example: 2 x KU3160 load break switches

### 3P + 3P or 3P + 4P switch configurations

The standard CO160KU can be assembled straight onto a left 3P switch, and right side 3P or 4P switch.

### 4P + 3P switch configurations

For this combination, a factory re-assembly of the left side 4P switch is required, which makes this an APS factory assembled item – refer APS.

### 4P + 4P switch configurations

Refer pre-assembled types: KU4100CO, KU4125CO or KU4160CO, or refer APS. If these changeover types are not in stock, in order to create them using stocked 4P switches. A factory reassembly of the left 4P switch is required, which makes this an APS factory assembled item.

## General Overview

The increasing demand of electrical power and the awareness of the necessity of energy saving is very important these days. Also the awareness of power quality is increasing and power factor correction (PFC) and harmonic filtering will be implemented on a growing scale. Enhancing power quality – improvement of power factor – saves costs and ensures a fast return on investment. In power distribution, in low- and medium-voltage networks, PQS focuses on the power flow ( $\cos \Phi$ ) and the optimization of voltage stability by generating reactive power and compensation current to improve voltage quality and reliability at distribution level.

APS Industrial offers a comprehensive range on Electrical and Electronic components, equipment and services for the modern Power Factor Correction switchboard, Active Harmonic Filter Panel and Power Distribution Boards. # POWER FACTOR CORRECTION

## How reactive power is generated

Every electric load that works with magnetic fields (motors, chokes, transformers, inductive heating, arc welding, generators) produces a varying degree of electrical lag, which is called inductance. This lag of inductive loads maintains the current sense (e.g. positive) for a time even though the negative-going voltage tries to reverse it. This phase shift between current and voltage is maintained, current and voltage having opposite signs. During this time, negative power or energy is produced and fed back into the network. When current and voltage have the same sign again, the same amount of energy is again needed to build up the magnetic fields in inductive loads. This magnetic reversal energy is called reactive power.

In AC networks (50/60 Hz) such a process is repeated 50 or 60 times a second. So an obvious solution is to briefly store the magnetic reversal energy in capacitors and relieve the network (supply line) of this reactive energy. For this reason, automatic reactive power compensation systems (detuned/conventional) are installed for larger loads like industrial machinery. Such systems consist of a group of capacitor units that can be cut in and cut out and which are driven and switched by a power factor controller.

## Power Factor

### Low Power Factor ( $\cos \phi$ )

- | Low  $\cos \phi$  results in higher energy consumption and costs,
- | less power distributed via the network,
- | power loss in the network,
- | higher transformer losses,
- | increased voltage drop in power distribution networks.

## Power Factor Improvement

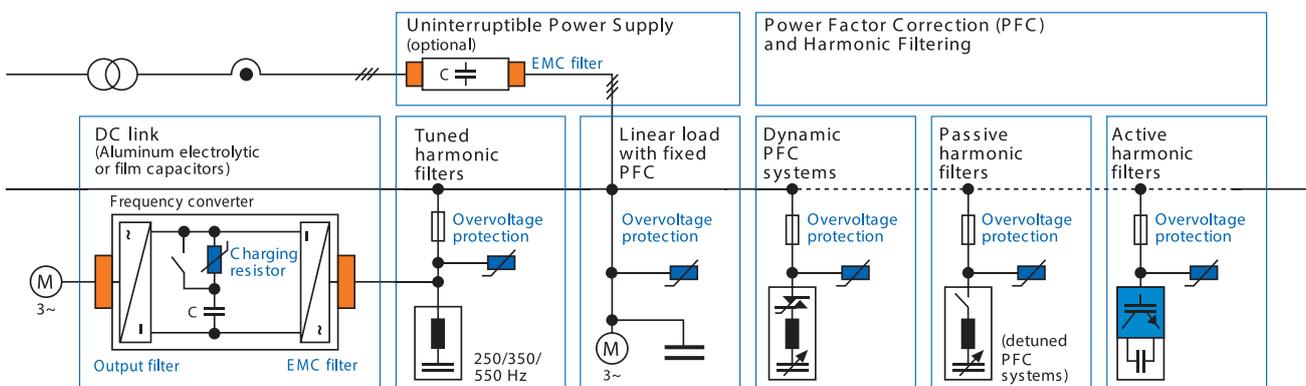

Power factor improvement can be achieved by

- | compensation of reactive power with capacitors,
- | active compensation – using semiconductors,
- | overexcited synchronous machine (motor/generator)

## Types of PFC

### (detuned or conventional)

- | individual or fixed compensation (each reactive power producer is individually compensated),
- | group compensation (reactive power producers connected as a group and compensated as a whole),
- | central or automatic compensation (by a PFC system at a central point), mixed compensation.

## Thyristor Modules for Dynamic PFC

Conventional systems for power factor correction are used to optimize the power factor and reduce the level of harmonics in the grid. The usage of new technologies in modern industry has negative impacts on electric power quality of the main supply networks, e.g. frequent high load fluctuations and harmonic oscillation.

Excessive currents, increased losses and flickering will not only influence the supply capacity but will also have a significant impact on the operation of sensitive electronic devices.

The solution for this are dynamic power factor correction systems. With the thyristor module series TSM-LC and TSM-HV, we provide the main component – “the electronic switch” – for dynamic power factor correction. The TSM module

# CONTACTORS

“When a capacitor is switched to an AC voltage, the result is a resonant circuit damped to a greater or lesser degree. The switching of capacitors can cause high inrush currents, particularly when they are switched in parallel to others already activated in the power line, and if high short-circuit powers are present on the line.

Capacitor contactors with damping resistors make use of preswitching auxiliary contacts. They close before the main contacts and pre-load the capacitor thus avoiding current peak values.”

- | Longer useful service life of main contacts of capacitor contactor
- | Soft switching of capacitor and thus longer useful service life

- | Reduced ohmic losses
- | Leading contacts with wiper function
- | Tamper-proof and protected resistors
- | Easy access for cable connection
- | Voltage range: 400 ... 690 V
- | Output range: 12.5 ... 100 kvar

## Reactors – Antiresonance Harmonic Filter

### General

The increasing use of modern power electronic apparatus (drives, uninterruptible power supplies, etc) produces nonlinear current and thus influences and loads the network with harmonics (line pollution).

The power factor correction or capacitance of the power capacitor forms a resonant circuit in conjunction with the feeding transformer.

Experience shows that the selfresonant frequency of this circuit is typically between 250 and 500 Hz, i.e. in the region of the 5th and 7th harmonics.

Such a resonance although can lead to the following undesirable effects:

- | overloading of capacitors,
- | overloading of transformers and transmission equipment,
- | interference with metering and control systems, computers and electrical gear,
- | resonance elevation, i.e. amplification of harmonics,
- | voltage distortion.

These resonance phenomena can be avoided by connecting capacitors in series with filter reactors in the PFC system. These so called “detuned” PFC systems are scaled in a way that the self-resonant frequency is below the lowest line harmonic. The detuned PFC system is purely inductive seen by harmonics above this frequency. For the base line frequency (50 or 60 Hz usually), the detuned system on the other hand acts purely capacitive, thus correcting the reactive power.”

### Application

- | Avoidance of resonance conditions

# STATIC VAR GENERATOR

EPCOS has been offering a comprehensive range of key components for Power Factor Correction (PFC) and Power Quality Solutions (PQS) for many years. The rapid development of industry and infrastructure resulted in the increased usage of power electronic loads which demands a highly dynamic response time for reactive power compensation. Conventional reactive power compensation only with passive components cannot fully meet these conditions, especially when the reactive power requirement is rapidly changing.

- | EPCOS Static Var Generator (SVG) PQvar Series utilizes three levels inverter topology to provide real time response to reactive power requirements)
- | EPCOS Static Var Generator (SVG) PQvar Series is a Flexible AC Transmission Systems (FACTS) controller, whose capacitive or inductive output current can be controlled independent of the AC system voltage.
- | SVG PQvar Series is a parallel device connected to the grid and the main circuit is based on a three phase voltage source converter (VSI) topology. External CT measures load current and external DSP helps to calculate and analyze the required reactive current.
- | SVG PQvar Series controls PWM signals and sends control message to IGBT modules which generate reactive current in order to improve system power factor.
- | SVG PQvar Series provides faster compensation compared to conventional compensation systems such as capacitor banks. Thus, it is an ideal solution especially for fast loads of inductive or capacitive behavior. It can compensate both inductive and capacitive reactive current without under or over compensation. Static Var Generator (SVG) PQvar™ Series
  - New approach to power factor correction and load balancing
  - Fast response time < 15 ms, with dynamic reaction time less than 50 μs

## Operating principle of SVG PQvar Series

SVG PQvar Series generates a compensation current working as a dynamic current source, monitors the power factor value of power system, and generates real time compensation current in order to ensure to achieve the set target  $\cos \phi$ .

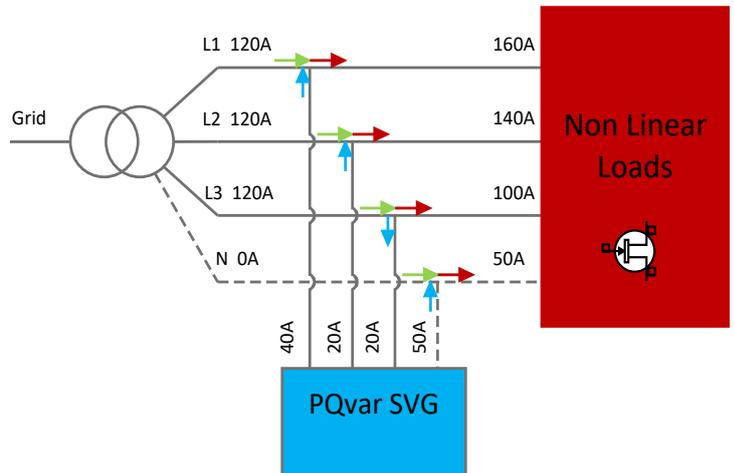

## STEPLESS COMPENSATION

Unlike traditional stepped capacitor based PFC equipment, a SVG supplies stepless compensation

## SVG PQvar Series load balancing for 3P3W and 3P4W

SVG PQvar Series can balance load between phases and unloaded neutral wire for input voltage connection systems such as three phase three wires (3P3W) and three phase four wires (3P4W). Therefore, it will be a perfect solution with applications having reactive power requirements along with unbalanced loads, which is the case with the electricity distribution in rural areas, some industrial applications and much more.

# STATIC VAR GENERATOR

## General information

SVG PQvar Series is a new product which has rewritten the conventional approach of power factor correction. It is designed to compensate the rapid reactive power requirement, thereby improving the power factor and consequently reducing the costs. SVG PQvar Series monitors the current signal and utilizes three levels inverter topology which generate the reactive part of the measured current to compensate dynamically in order to improve the power factor. It can dynamically compensate power factor from -1 to 1.

## Features

- | SVG PQvar Series can be considered as a controllable reactive current source, which helps to improve the system power factor to a target value of more than  $> 0.99$  without any over or under compensation.
- | SVG PQvar Series has extremely rapid dynamic compensation reaction time, which is less than  $50 \mu\text{s}$  and a state response time of less than 15 ms.
- | SVG PQvar Series is an active compensation device, which doesn't need capacitor or reactor for reactive power compensation which will avoid the condition of resonance caused by the traditional capacitor banks.
- | SVG PQvar Series can compensate both inductive and capacitive reactive power and also provide load balancing.
- | SVG PQvar Series can compensate reactive power in any scope and can be installed together with traditional capacitor banks.
- | The grid voltage has no influence on the SVG PQvar Series compensation capacity. So even if the system voltage drops down, the required reactive power can be compensated by monitoring its requirement.
- | SVG PQvar Series can compensate for the same capacity equivalent to the installed capacity, therefore it requires 20 to 30% lower capacity in comparison with the conventional capacitor banks.

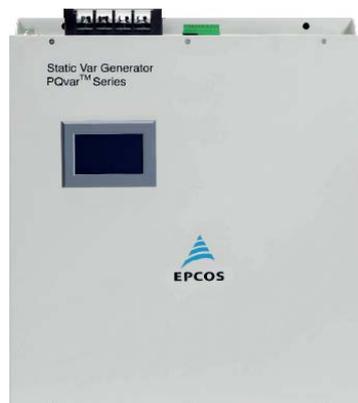

## Typical applications

Some typical applications which require rapid reactive power compensation includes the following:

- | Data centers
- | UPS systems
- | Renewable power generation (e.g. photovoltaics and wind turbines)
- | Sensitive equipment manufacturing (e.g. silicon wafer production, semiconductor production)
- | Industrial production machines
- | Electrical welding systems
- | Plastic industry machinery (e.g. extruders, injection molders)

## Safety features

- | Overload protection
- | Internal short-circuit protection
- | Overheating protection
- | Overvoltage and undervoltage protection
- | Inverter bridge protection
- | Fan fault alarm

## ACTIVE HARMONIC FILTERING

Today, most loads react non-linear. When connected to a sinusoidal voltage, these loads produce non sinusoidal currents which in turn creates distortion in the voltage supply called "Harmonic Distortion". The most widely used examples of non-linear loads today are Power electronics like Switch Mode Power Supplies which power our every day devices e.g. TVs, Laptops and Mobile Phone Chargers. In our industrial environment power electronics are used in Variable Speed Drives, Un-Interruptible Power Supplies and Arc devices like Arc Welders and Arc Furnaces.

The voltage distortion caused by these machines can lead to:

- | Additional investment due to faster equipment derating
- | Higher energy consumption
- | Higher downtime of production equipment
- | Higher maintenance and repair cost
- | Reduced product quality
- | Reduced production output

Solutions for reducing the harmonic content can be:

- | To increase fault level (reduction of impedances)
- | Limiting total output / simultaneously working harmonic sources
- | Balanced connection of 1-phase loads to the 3-phases
- | Using equipment with higher pulse number

Use harmonic filtering techniques:

- | De-tuned passive harmonic filters
- | Tuned passive harmonic filters
- | Active harmonic filtersActive Harmonic Filtering

EPCOS has been offering a comprehensive range of key components for power factor correction (PFC) and power quality solutions (PQS) for many years. In the past, most consumer loads were linear, i.e. when they were connected to a sinusoidal voltage, the current was also sinusoidal. In the meantime, the use of power electronics has significantly increased. These devices are usually non-linear, i.e. when connected to a sinusoidal voltage they produce non-sinusoidal currents which may create problems for other devices.

Besides passive filters, more and more active harmonic filters are now used, especially where the PF is close to 1 and harmonic disturbances change frequently.

The PQSine S-series of active filters and power optimizers from EPCOS:

- | Eliminate harmonics up to the 50th order
- | Offer dynamic VAR compensation
- | Balance the load actively to all phases
- | Offer high performance
- | Have a three-level topology
- | Improve power quality and enhance system reliability
- | Ensure integrated overload, overvoltage and undervoltage protection
- | Ensure low life-cycle costs thanks to a modular concept and low losses.

### The cleaner the grid, the greater the benefit

EPCOS active harmonic filters and power optimizers help to eliminate harmonic pollution from the grid, reduce power quality problems and use energy more efficiently and reliably.

Harmonic pollution is a growing problem with the increasing use of power electronics and non-linear loads (such as variable speed drives, UPS, computers, servers, TV sets, etc.).

The presence of harmonics increases the RMS current in power networks. The circulation of harmonic currents through the system impedance creates voltage harmonics which produce voltage distortions and thus deteriorate the quality of the supply voltage. This leads to higher operating and energy costs, production/process downtimes, overheating and malfunction of equipment.

# ACTIVE HARMONIC FILTERING

The active harmonic filters and power optimizers of the PQSine S-series from EPCOS are based on the latest state of the art in power electronics technology. They are installed in parallel to the polluting loads. The active filter analyzes the line current and its associated harmonics and generates a compensation current which neutralizes the harmonic currents and creates an almost sinusoidal waveform (see Figure 1). Figure 2 shows the total current harmonic distortion without PQSine S-series. Figure 3 shows the result with activated PQSine S-series, namely a cleaner grid.

In addition to eliminating the harmonics, the PQSine S-series active filter and power optimizer also actively balances the loads to all three phases, performs dynamic VAR compensation and even some transient compensation. These features avoid line resonance and ensure high performance and reliability.

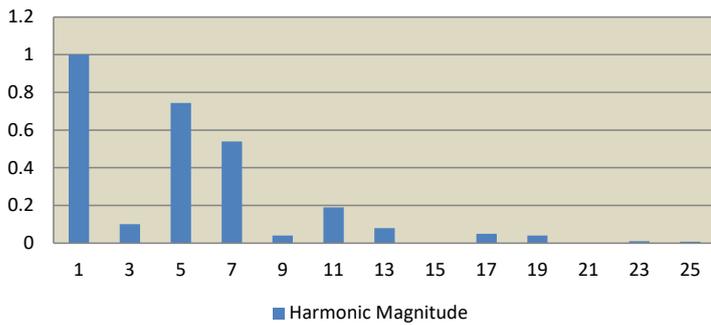

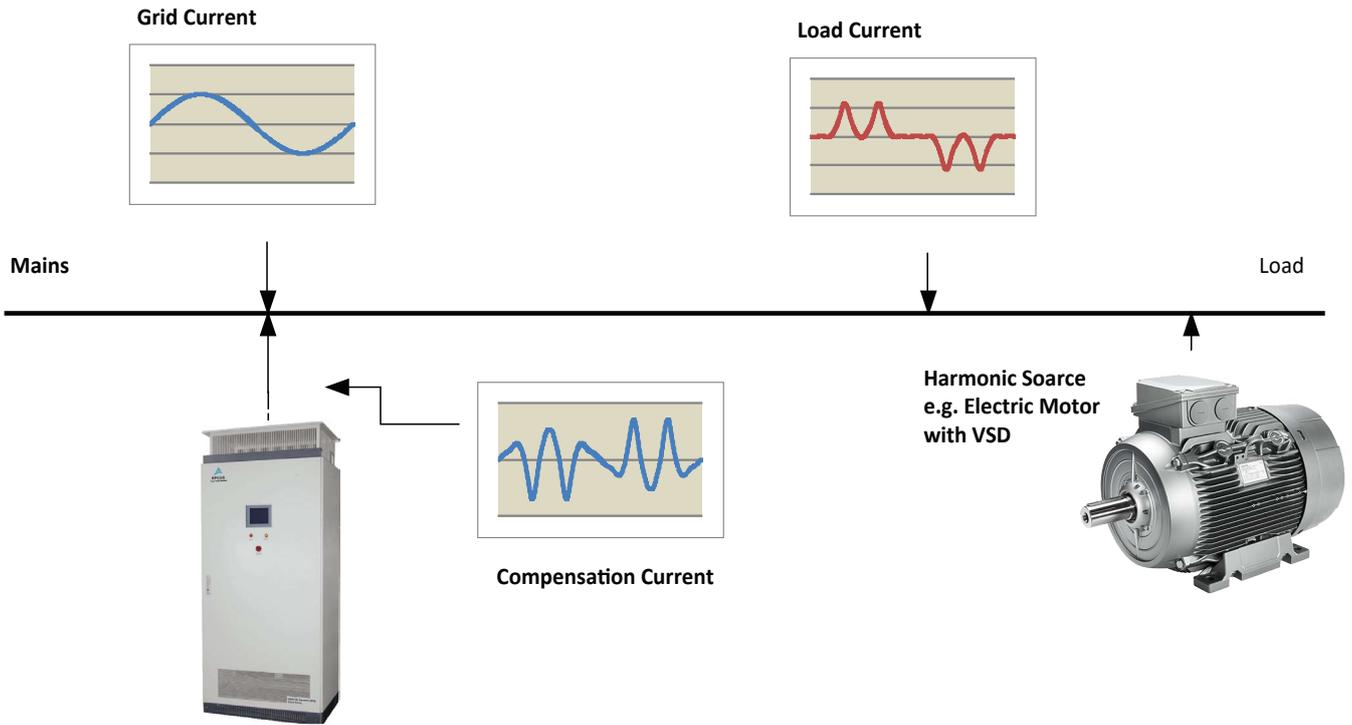

Figure 2

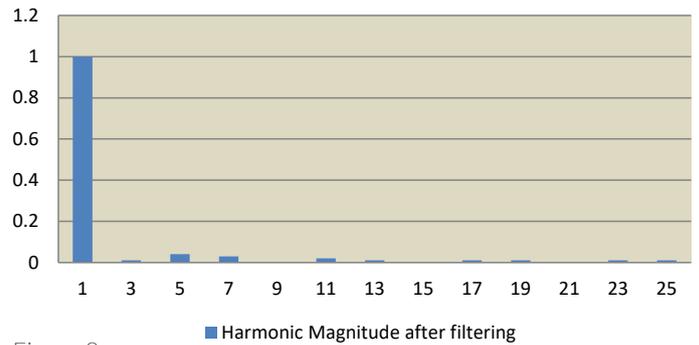

Figure 3

# ACTIVE HARMONIC FILTERING

The PQSine S-series is an active harmonic filter system designed to eliminate harmonic oscillations and consequently reduce costs. PQSine S-series monitors the current signal and compensates the unwanted elements of the measured current. Thus, the filter ensures harmonic suppression independently of the number of loads. It also corrects the power factor, improving the system efficiency while reducing harmonic pollution.

## FLEXIBLE STEEL CONDUIT

Ramtight flexible steel conduit has been designed and manufactured to the highest standard ISO 9001:2008 and complies with AS/NZS 2053.8. This ensures you are getting a high quality product which is suitable for use in all arduous areas including industrial and hazardous areas.

Ramtight Flexible conduit is manufactured from a galvanised steel core with a nylon sealing core fitted between the spiral cores and is covered with a flexible flame retardant PVC jacket. Ramtight is also resistant to sun light and oil and has an IP66 rating when fitted with Ramtight nickel plated brass or steel fittings.

Ramtight's construction allows it to be very flexible and gives it the ability to both absorb vibration and continuous movement making it ideal to use on conveyors and automatic machinery or wherever heavy duty mechanical protection is required.

# PERMANENT ELECTRICAL SAFETY DEVICES

The range of Grace Permanent Electrical Safety Devices (PESDs) from APS Industrial engineer out the risk associated with routine maintenance tasks allowing them to be safely conducted from outside of the electrical cabinet. In turn, this inherently reduces the risk of arc flash and shock hazards significantly.

When properly incorporated into a facility's electrical and mechanical Lockout/Tagout (LOTO) safety procedures, Grace PESDs enhance safety and increase productivity. In addition, when properly incorporated into a facility's LOTO procedure, Grace SafeSide® thru-door voltage indicators, Safe-Test Points™ and combination units inherently reduce risk by providing a safer and more productive method of performing verification of hazardous energy isolation, thereby enhancing energy isolation principles.

# What do PESDs really do?

## GRACE SafeSide® VOLTAGE INDICATOR PESDs

Voltage indicators are PESDs that visually represent presence of voltage with flashing or non-flashing, redundant LED lights. Typically hardwired to the load side of disconnect, voltage indicators illuminate whenever hazardous voltage or stored energy is present in any individual phase.

## GRACE SAFE TEST-POINT™ PESD

Safe-Test Point™ allows qualified personnel to perform absence of voltage tests safely from outside an electrical cabinet. The device reduces the risk of arc flash and shock hazards.

## GRACE COMBINATION PESDs

Combination units include true voltage indicator and test point PESDs and place them both within a single protective housing to produce a Voltage Test Station (VTS).
